Read product label carefully and follow all label directions. Conditioning prior to bait usage is mandatory.

Our state-of-the-art facilities are located near the Front Range of the Rockies, in Northern Colorado. The Kaput® staff has over 100 years experience in rodent control and formulation development. We have done extensive rodent research and management in over 60 countries. Our scientists have written more than 100 industry-related publications and have over 30 years experience in rodent and mole control, research and product development. Kaput® is a family operated business, dedicated to developing products that exceed expectations. Cutting edge products with the greatest formulation is what you can expect from Kaput®.

Our mission is to treat each customer as we would want to be treated, by delivering ethical behavior, honest value, and quality service, and products that exceed expectations. Years of research and testing are an integral part of our product development process and our success depends on superior quality and efficacy.

---

**THE FACTS ON FIRST GENERATION ANTICOAGULANTS AND THE WARFARIN MYTH**

- First generation anticoagulants kill rodents over the same time period as second generation.
- A rat or mouse may feed on any bait over 50 times before it dies.
- Poor or insufficient placement of bait stations can be mistaken for resistance.
- Norway Rats from Chicago (thought to be first generation resistant) had a 100% mortality rate with 0.025% warfarin found in Kaput® products.
- Refined warfarin is a different form than that used in earlier 1970’s testing that generated the inaccurate “warfarin resistance” claim. It also no longer contains the metabolites that were distasteful.
- The Warfarin based drug (Coumadin) is the most commonly used blood thinner today for human patients.

Vitamin K1 is the antidote for all products containing warfarin, diphacinone and bromadiolone.
